

Chapter 1. Rational and Irrational Numbers

Exercise 1.1

Solution (1)

Given rational numbers are $\frac{2}{9}$ and $\frac{3}{8}$

LCM of denominators 9 and 8 is 72

Equivalent fractions of ' $\frac{2}{9}$ ' and ' $\frac{3}{8}$ ' with denominator 72

$$\frac{2}{9} = \frac{2 \times 8}{9 \times 8} = \frac{16}{72}$$

$$\frac{3}{8} = \frac{3 \times 9}{8 \times 9} = \frac{27}{72}$$

Since, $16 < 27$, $\frac{16}{72} < \frac{27}{72}$

$$\text{So, } \frac{2}{9} < \frac{3}{8}$$

A rational number between $\frac{2}{9}$ and $\frac{3}{8}$ is

$$\begin{aligned} & \frac{\frac{2}{9} + \frac{3}{8}}{2} \\ &= \frac{\frac{2 \times 8 + 3 \times 9}{72}}{2} \\ &= \frac{16 + 27}{72 \times 2} \\ &= \frac{43}{144} \end{aligned}$$

Descending order of the numbers is $\frac{3}{8}, \frac{43}{144}, \frac{2}{9}$

$$\frac{2}{9} < \frac{43}{144} < \frac{3}{8}$$

Solution (2):

Method II:

L.C.M of 3 and 4 is 12.

Rational number between $\frac{1}{3}$ and $\frac{1}{4}$ is $\frac{\frac{1}{3} + \frac{1}{4}}{2}$

$$= \frac{\frac{4+3}{12}}{2}$$

$$= \frac{7}{12 \times 2}$$

$$= \frac{7}{24}$$

$$\frac{1}{3} = \frac{1 \times 4}{3 \times 4} = \frac{4}{12}$$

$$\frac{1}{4} = \frac{1 \times 3}{4 \times 3} = \frac{3}{12}$$

$$\text{Since, } 4 > 3 \therefore \frac{4}{12} > \frac{3}{12}$$

$$\frac{1}{3} > \frac{1}{4}$$

$\frac{7}{24}$ is in between $\frac{1}{3}$ and $\frac{1}{4}$. So, $\frac{1}{3} > \frac{7}{24} > \frac{1}{4} \rightarrow \textcircled{1}$

Rational number between $\frac{1}{3}$ and $\frac{7}{24}$ is $\frac{\frac{1}{3} + \frac{7}{24}}{2}$

$$= \frac{\frac{1 \times 8 + 7 \times 1}{24}}{2}$$

$$= \frac{15}{2 \times 24}$$

$$= \frac{15}{48}$$

$\frac{15}{48}$ is in between $\frac{1}{3}$ and $\frac{7}{24}$. So, $\frac{1}{3} > \frac{15}{48} > \frac{7}{24} \rightarrow \textcircled{2}$

From $\textcircled{1}$ and $\textcircled{2}$, ascending order of numbers (increasing order)

$$\text{is } \frac{1}{4} < \frac{7}{24} < \frac{15}{48} < \frac{1}{3}$$

Solution (3)

Given rational numbers are $-\frac{1}{3}$ and $-\frac{1}{2}$

LCM of 3 and 2 is 6.

$$-\frac{1}{3} = \frac{-1 \times 2}{3 \times 2} = \frac{-2}{6} ; \quad -\frac{1}{2} = \frac{-1 \times 3}{2 \times 3} = \frac{-3}{6}$$

Since, $2 < 3$

$$-2 > -3$$

$$\frac{-2}{6} > \frac{-3}{6}$$

$$\text{So, } -\frac{1}{3} > -\frac{1}{2}$$

Rational number between $-\frac{1}{3}$ and $-\frac{1}{2}$ is $\frac{-\frac{1}{3} + (-\frac{1}{2})}{2}$

$$= \frac{-1 \times 2 + (-1) \times 3}{6}$$

$$= \frac{-2 - 3}{6 \times 2}$$

$$= \frac{-5}{12}$$

$$\therefore -\frac{1}{3} > -\frac{5}{12} > -\frac{1}{2} \rightarrow \textcircled{1}$$

Rational number between $-\frac{1}{3}$ and $-\frac{5}{12}$ is $\frac{-\frac{1}{3} + (-\frac{5}{12})}{2}$

$$= \frac{-1 \times 4 + (-5) \times 1}{12}$$

$$= \frac{-4 - 5}{12 \times 2}$$

$$= \frac{-9}{24}$$

$$\therefore -\frac{1}{3} > -\frac{9}{24} > -\frac{5}{12} \rightarrow \textcircled{2}$$

From (1) and (2), $-\frac{1}{3} > -\frac{9}{24} > -\frac{5}{12} > -\frac{1}{2}$

Ascending order (increasing order) of rational numbers

$$-\frac{1}{2}, -\frac{5}{12}, -\frac{9}{24}, -\frac{1}{3}$$

Solution (4):

LCM of 3 and 5 is 15.

$$\frac{1}{3} = \frac{1 \times 5}{3 \times 5} = \frac{5}{15} \quad ; \quad \frac{4}{5} = \frac{4 \times 3}{5 \times 3} = \frac{12}{15}$$

Since, $5 < 12$

$$\text{So, } \frac{5}{15} < \frac{12}{15}$$

$$\frac{1}{3} < \frac{4}{5}$$

Rational number between $\frac{1}{3}$ and $\frac{4}{5}$ is $\frac{\frac{1}{3} + \frac{4}{5}}{2}$

$$= \frac{\frac{1 \times 5 + 4 \times 3}{3 \times 5}}{2}$$

$$= \frac{\frac{5 + 12}{15}}{2}$$

$$= \frac{17}{30}$$

Rational number between $\frac{1}{3}$ and $\frac{17}{30}$ is

$$\frac{\frac{1}{3} + \frac{17}{30}}{2}$$

$$= \frac{\frac{1 \times 10 + 17}{30}}{2}$$

$$= \frac{27}{60}$$

Rational number between $\frac{17}{30}$ and $\frac{4}{5}$ is

$$\begin{aligned} & \frac{\frac{17}{30} + \frac{4}{5}}{2} \\ &= \frac{\frac{17 + 4 \times 6}{30}}{2} \\ &= \frac{41}{60} \end{aligned}$$

→ Rational numbers between $\frac{1}{3}$ and $\frac{4}{5}$ are

Descending order (decreasing order) of numbers are

$$\frac{4}{5}, \frac{41}{60}, \frac{17}{30}, \frac{27}{60}, \frac{1}{3}$$

Solution ⑤:

A rational number between 4 and 4.5 is $\frac{4+4.5}{2} = \frac{8.5}{2}$
 $= 4.25$

A rational number between 4 and 4.25 = $\frac{4+4.25}{2} = \frac{8.25}{2}$
 $= 4.125$

A rational number between 4 and 4.125 = $\frac{4+4.125}{2} = \frac{8.125}{2}$
 $= 4.0625$

Three rational numbers between 4 and 4.5 are

$$4.0625, 4.125, 4.25$$

Solution (6):

We need to insert six rational numbers between 3 and 4. So, we multiply both numerator and denominator of rational numbers with $6+1$ i.e. 7.

$$\text{So, } \frac{3}{1} = \frac{3 \times 7}{1 \times 7} = \frac{21}{7}$$

$$\frac{4}{1} = \frac{4 \times 7}{1 \times 7} = \frac{28}{7}$$

We have, $21 < 22 < 23 < 24 < 25 < 26 < 27$

$$\Rightarrow \frac{21}{7} < \frac{22}{7} < \frac{23}{7} < \frac{24}{7} < \frac{25}{7} < \frac{26}{7} < \frac{27}{7} < \frac{28}{7}$$

Therefore, six rational numbers between 3 and 4

$$\text{are } \frac{22}{7}, \frac{23}{7}, \frac{24}{7}, \frac{25}{7}, \frac{26}{7}, \frac{27}{7}.$$

Solution (7):

We need to insert five rational numbers between $\frac{3}{5}$ and $\frac{4}{5}$. So, we multiply both numerator and denominator with $5+1$ i.e. 6.

$$\text{So, } \frac{3}{5} = \frac{3 \times 6}{5 \times 6} = \frac{18}{30}$$

$$\frac{4}{5} = \frac{4 \times 6}{5 \times 6} = \frac{24}{30}$$

We have, $18 < 19 < 20 < 21 < 22 < 23 < 24$

$$\Rightarrow \frac{18}{30} < \frac{19}{30} < \frac{20}{30} < \frac{21}{30} < \frac{22}{30} < \frac{23}{30} < \frac{24}{30}$$

Therefore, five rational numbers between $\frac{3}{5}$ and $\frac{4}{5}$.

$$\frac{19}{30}, \frac{20}{30}, \frac{21}{30}, \frac{22}{30}, \frac{23}{30}.$$

Solution (8):

LCM of 5 and 7 is 35.

$$\frac{-2}{5} = \frac{-2 \times 7}{5 \times 7} = \frac{-14}{35} \quad ; \quad \frac{1}{7} = \frac{1 \times 5}{7 \times 5} = \frac{5}{35}$$

We need to insert ten rational numbers between $\frac{-2}{5}$ ($= \frac{-14}{35}$) and $\frac{1}{7}$ ($= \frac{5}{35}$). So, we can select any ten numbers between -14 and 5 as numerators and '35' as denominator.

$$\therefore \frac{-13}{35}, \frac{-12}{35}, \frac{-11}{35}, \frac{-10}{35}, \frac{-9}{35}, \frac{-8}{35}, \frac{-7}{35}, \frac{-6}{35}$$

$\frac{-5}{35}, \frac{-4}{35}$ are ten rational numbers which are in between $\frac{-2}{5}$ and $\frac{1}{7}$.

Solution (9)

LCM of 2 and 3 is 6.

$$\frac{1}{2} = \frac{1 \times 3}{2 \times 3} = \frac{3}{6} \quad ; \quad \frac{2}{3} = \frac{2 \times 2}{3 \times 2} = \frac{4}{6}$$

We need to insert six rational numbers. So, multiply both numerator and denominator by 6+1 i.e., 7.

$$\frac{3}{6} = \frac{3 \times 7}{6 \times 7} = \frac{21}{42} \quad ;$$

$$\frac{4}{6} = \frac{4 \times 7}{6 \times 7} = \frac{28}{42}$$

Since, $21 < 22 < 23 < 24 < 25 < 26 < 27 < 28$

$$\frac{21}{42} < \frac{22}{42} < \frac{23}{42} < \frac{24}{42} < \frac{25}{42} < \frac{26}{42} < \frac{27}{42} < \frac{28}{42}$$

Therefore, Six numbers between $\frac{1}{2}$ and $\frac{2}{3}$

$$\text{are } \frac{22}{42}, \frac{23}{42}, \frac{24}{42}, \frac{25}{42}, \frac{26}{42}, \frac{27}{42}$$

Exercise - 1.2

Solution 1:

Let $\sqrt{5}$ be a rational number, then

$\sqrt{5} = \frac{p}{q}$, where p, q are integers, $q \neq 0$ and p, q have no common factors (except 1).

$$\Rightarrow 5 = \frac{p^2}{q^2}$$

$$p^2 = 5 \cdot q^2 \quad \longrightarrow (i)$$

As '5' divides $5q^2$, so '5' divides p^2 and '5' is prime

\Rightarrow 5 divides p .

Let $p = 5 \cdot m$, where m is an integer

Substituting the value of 'p' in (i)

$$(5m)^2 = 5 \cdot q^2$$

$$25 \cdot m^2 = 5 \cdot q^2$$

$$\Rightarrow q^2 = 5 \cdot m^2$$

As 5 divides $5m^2$, so 5 divides q^2 but 5 is prime

\Rightarrow 5 divides q .

Thus, p and q have a common factor 5. This contradicts that 'p' and 'q' have no common factors (except 1).

Hence, $\sqrt{5}$ is not rational number.

So, we conclude $\sqrt{5}$ is an irrational number.

Solution 2:

Let $\sqrt{7}$ be a rational number.

$\sqrt{7} = \frac{p}{q}$, where p, q are integers, $q \neq 0$ and p, q have no common factors (except 1).

$$\Rightarrow 7 = \frac{p^2}{q^2}$$

$$p^2 = 7 \cdot q^2 \rightarrow (i)$$

As 7 divides $7q^2$, so 7 divides p^2 and 7 is a prime

\Rightarrow 7 divides p

Let $p = 7m$, where 'm' is an integer

Substitute this value of 'p' in \therefore we have.

$$(7m)^2 = 7 \cdot q^2$$

$$49 \cdot m^2 = 7 \cdot q^2$$

$$q^2 = 7 \cdot m^2$$

As 7 divides $7m^2$, so 7 divides q^2 but 7 is a prime number.

\Rightarrow 7 divides q

Thus, 'p' and q have a common factor 7. This contradicts that p and q have no common factor (except 1).

Hence, $\sqrt{7}$ is not a rational number.

So, we conclude $\sqrt{7}$ is irrational number.

Solution 3:

Let $\sqrt{6}$ be a rational number.

$\sqrt{6} = \frac{p}{q}$, where p and q are integers, $q \neq 0$ and p, q have no common factors (except 1).

$$\Rightarrow 6 = \frac{p^2}{q^2}$$

$$p^2 = 6 \cdot q^2 \rightarrow (i)$$

As '2' divides $6q^2$, so 2 divides p^2 but 2 is prime

\Rightarrow 2 divides p .

Let $p = 2 \cdot m$, where 'm' is an integer.

Substitute this value of 'p' in (i)

$$(2m)^2 = 6 \cdot q^2$$

$$4 \cdot m^2 = 6 \cdot q^2$$

$$2 \cdot m^2 = 3 \cdot q^2$$

'2' divides '2m²', so 2 divides '3q²'

2 should either divide '3' or divide q².

But 2 should does not divide 3.

Therefore, 2 divides q² and 2 is a prime

2 divides q.

Thus, p and q have a common factor 2. This contradicts that ' p ' and ' q ' have no common factors (except 1).

Hence, $\sqrt{6}$ is not rational number.

So, we conclude $\sqrt{6}$ is irrational number.

Solution 4 :-

Let $\frac{1}{\sqrt{11}}$ be a rational number.

$\frac{1}{\sqrt{11}} = \frac{p}{q}$, where 'p', 'q' are integers, $q \neq 0$ and p, q have no common factors (except 1).

$$\Rightarrow \frac{1}{11} = \frac{p^2}{q^2}$$

$$\Rightarrow q^2 = 11 \cdot p^2 \rightarrow \text{i}$$

As 11 divides $11p^2$, so 11 divides q^2 but 11 is a prime.

$$\Rightarrow 11 \text{ divides } q.$$

$q = 11m$, where 'm' is an integer.

$$(11m)^2 = 11p^2$$

$$\Rightarrow 121 \cdot m^2 = 11 \cdot p^2$$

$$\Rightarrow p^2 = 11 \cdot m^2$$

As 11 divides $11m^2$, so 11 divides p^2 but 11 is a prime.

$$\Rightarrow 11 \text{ divides } p.$$

Thus, p and q have a common factor 11. This contradicts the fact that p and q has no common factors (except 1).

Hence, $\frac{1}{\sqrt{11}}$ is not rational number.

So, we conclude $\frac{1}{\sqrt{11}}$ is irrational number.

Solution 5:

Let $\sqrt{2}$ is a rational number.

$\sqrt{2} = \frac{p}{q}$, where p and q are integers, $q \neq 0$ and p, q have no common factors (except 1).

$$\Rightarrow 2 = \frac{p^2}{q^2}$$

$$p^2 = 2 \cdot q^2 \rightarrow (i)$$

As '2' divides $2q^2$, so 2 divides p^2 but 2 is prime.

\Rightarrow 2 divides p .

Let $p = 2m$, where 'm' is an integer.

Substitute this value of p in (i).

$$(2m)^2 = 2q^2$$

$$4m^2 = 2q^2$$

$$\Rightarrow q^2 = 2m^2$$

As 2 divides $2m^2$, so 2 divides q^2 but 2 is prime.

2 divides q

Thus, p and q have a common factor 2. This contradicts the fact that p and q has no common factor (except 1).

Hence, $\sqrt{2}$ is not rational number.

So, we conclude $\sqrt{2}$ is irrational number.

Let us assume $3 - \sqrt{2}$ is rational number, say r .

$$\text{Thus, } 3 - \sqrt{2} = r \Rightarrow 3 - r = \sqrt{2}$$

As 'r' is rational, $3 - r$ is rational $\Rightarrow \sqrt{2}$ is rational

this contradicts the fact that $\sqrt{2}$ is irrational

Hence, our assumption is wrong. Therefore, $3 - \sqrt{2}$ is an irrational number.

Solution 6:

Let $\sqrt{3}$ is a rational number.

$\sqrt{3} = \frac{p}{q}$, where p and q are integers, $q \neq 0$ and p, q have no common factors (except 1).

$$3 = \frac{p^2}{q^2}$$

$$\Rightarrow p^2 = 3q^2 \longrightarrow (i)$$

As '3' divides $3q^2$, so 3 divides p^2 but 3 is a prime.

$$\Rightarrow 3 \text{ divides } p$$

Let $p = 3 \cdot m$, where 'm' is an integer.

substituting this value of p in (i).

$$(3m)^2 = 3q^2$$

$$9m^2 = 3q^2$$

$$\Rightarrow q^2 = 3m^2$$

As '3' divides $3m^2$, so '3' divides q^2 but 3 is not prime.

$$\Rightarrow 3 \text{ divides } q$$

Thus, p and q have a common factor 3. This contradicts the fact that p and q has no common factor (except 1).

Hence, $\sqrt{3}$ is not rational number.

So, we conclude $\sqrt{3}$ is irrational number.

Let us assume $\frac{2}{5}\sqrt{3}$ is a rational number, say r .

$$\text{Thus } \frac{2}{5}\sqrt{3} = r \Rightarrow \sqrt{3} = \frac{5}{2} \cdot r$$

As r is rational, $\frac{5}{2}r$ is rational $\Rightarrow \sqrt{3}$ is rational.

This contradicts the fact that $\sqrt{3}$ is irrational.

Hence, our assumption is wrong. Therefore, $\frac{2}{5}\sqrt{3}$ is irrational number.

Solution 7:

Let $\sqrt{5}$ is a rational number.

$\sqrt{5} = \frac{p}{q}$, where p and q are integers, $q \neq 0$ and p, q have no common factors (except 1).

$$5 = \frac{p^2}{q^2}$$

$$\Rightarrow p^2 = 5q^2 \rightarrow (i)$$

As 5 divides $5q^2$, so 5 divides p^2 but 5 is a prime.

$$\Rightarrow 5 \text{ divides } p.$$

Let $p = 5m$ where m is an integer.

Substitute this value of m in (i)

$$(5m)^2 = 5q^2$$

$$25m^2 = 5q^2$$

$$q^2 = 5m^2$$

As 5 divides $5m^2$, 5 divides q^2 but 5 is a prime.

$$5 \text{ divides } q.$$

Thus, p and q have a common factor 5. This contradicts the fact that p and q has no common factors (except 1).

Hence, $\sqrt{5}$ is not rational number.

So, we conclude $\sqrt{5}$ is irrational number.

Let us assume $-3 + 2\sqrt{5}$ is a rational number, say r .

$$\text{Thus, } -3 + 2\sqrt{5} = r \Rightarrow -3 - r = 2\sqrt{5}$$

$$\Rightarrow \sqrt{5} = \frac{-(3+r)}{2}$$

As r is rational, $-\left(\frac{3+r}{2}\right)$ is rational $\Rightarrow \sqrt{5}$ is rational.

This contradict the fact that $\sqrt{5}$ is irrational.

Hence, our assumption is wrong, therefore, $-3 + 2\sqrt{5}$ is irrational number.

Solution (8):

(i) Let $5+\sqrt{2}$ is rational number, say r .

$$5+\sqrt{2}=r \Rightarrow \sqrt{2}=r-5$$

As r is rational, $r-5$ is rational $\Rightarrow \sqrt{2}$ is rational.

This contradicts the fact that $\sqrt{2}$ is irrational.

Hence, our assumption is wrong. Therefore, $5+\sqrt{2}$ is an irrational number.

(ii)

Let $3-5\sqrt{3}$ is rational number, say r .

$$3-5\sqrt{3}=r \Rightarrow 5\sqrt{3}=3-r$$

$$\Rightarrow \sqrt{3}=\left(\frac{3-r}{5}\right)$$

As r is rational, $\left(\frac{3-r}{5}\right)$ is rational $\Rightarrow \sqrt{3}$ is rational.

This contradicts the fact that $\sqrt{3}$ is irrational.

Hence, our assumption is wrong. Therefore, $3-5\sqrt{3}$ is an irrational number.

(iii)

Let $2\sqrt{3}-7$ is a rational number, say r .

$$2\sqrt{3}-7=r \Rightarrow 2\sqrt{3}=r+7$$

$$\sqrt{3}=\frac{r+7}{2}$$

As r is rational, $\left(\frac{r+7}{2}\right)$ is rational $\Rightarrow \sqrt{3}$ is rational.

This contradicts the fact that $\sqrt{3}$ is irrational.

Hence, our assumption is wrong. Therefore, $2\sqrt{3}-7$ is an irrational number.

Solution 8:

(iv) Let $\sqrt{2} + \sqrt{5}$ is a rational number, say r .

$$\sqrt{2} + \sqrt{5} = r$$

$$\sqrt{5} = r - \sqrt{2}$$

$$(\sqrt{5})^2 = (r - \sqrt{2})^2 \quad (\text{on squaring both sides})$$

$$5 = r^2 + (\sqrt{2})^2 - 2 \times r \times \sqrt{2} \quad [\because (a-b)^2 = a^2 + b^2 - 2ab]$$

$$5 = r^2 + 2 - 2\sqrt{2} \cdot r$$

$$2\sqrt{2} \cdot r = r^2 - 3$$

$$\sqrt{2} = \frac{r^2 - 3}{2 \cdot r}$$

As r is rational, $r^2 - 3$ is rational, $\left(\frac{r^2 - 3}{2r}\right)$ is rational

$\Rightarrow \sqrt{2}$ is rational

this contradicts the fact that $\sqrt{2}$ is irrational.

Hence, our assumption is wrong. Therefore,

$(\sqrt{2} + \sqrt{5})$ is an irrational number.

Exercise 1.3

solution 1:

PQ is a number line.

We have two right angle triangles. They are

$\triangle OAB$ and $\triangle OCD$.

In a right angled triangle,

$$(\text{hypotenuse})^2 = (\text{side 1})^2 + (\text{side 2})^2$$

$$\therefore OB^2 = OA^2 + AB^2$$

$$OB^2 = 3^2 + 1^2 \quad (\because OA = 3, AB = 1)$$

$$OB^2 = 9 + 1$$

$$OB = \sqrt{10}$$

Similarly, in $\triangle OCD$,

$$OD^2 = OC^2 + CD^2$$

$$OD^2 = 4^2 + 1^2$$

$$(\because OC = 4, CD = 1)$$

$$OD^2 = 16 + 1$$

$$OD = \sqrt{17}$$

Solution 2:-

(i) $\frac{36}{100}$

$$\begin{array}{r|l} & 0.036 \\ 100 & 360 \\ & \underline{300} \\ & 600 \\ & \underline{600} \\ & 0 \end{array}$$

Remainder becomes zero.

Decimal expansion of $\frac{36}{100} (=0.36)$ is terminating.

(ii) $4\frac{1}{8}$

$$= \frac{4 \times 8 + 1}{8}$$

$$= \frac{33}{8}$$

$$\begin{array}{r|l} & 4.125 \\ 8 & 33 \\ & \underline{32} \\ & 10 \\ & \underline{8} \\ & 20 \\ & \underline{16} \\ & 40 \\ & \underline{40} \\ & 0 \end{array}$$

Remainder becomes zero

Decimal expansion of $4\frac{1}{8} (=4.125)$ is terminating.

(iii) $\frac{2}{9}$

	0.22
9	20 18
	20 18
	2

← Remainder is repeating

In the above decimal expansion remainder is repeating. So, it is a non-terminating decimal.

So, $\frac{2}{9} = 0.222\dots = 0.\dot{2} = 0.\bar{2}$

(iv) $\frac{2}{11}$

	0.1818
11	20 11
	90 88
	20 11
	90 88
	2

← Remainder '2' is repeating.

Decimal expansion of $\frac{2}{11} = 0.1818\dots$

Here, remainder is repeating. So, it is a non-terminating repeating decimal.

$\therefore \frac{2}{11} = 0.\overline{18}$

(v) $\frac{3}{13}$

	0.230769
13	30 26
	40 39
	100 91
	90 78
	120 117
	3 ← Remainder '3' is repeating.

Decimal expansion of $\frac{3}{13}$ is 0.230769.....

Here, remainder is repeating. So, it a non-terminating repeating decimal.

$\therefore \frac{3}{13} = 0.\overline{230769}$

(vi) $\frac{329}{400}$

	0.8225
100	3290 3200
	900 800
	1000 800
	2000 2000
	0 ← Remainder is zero

Decimal Expansion of $\frac{329}{400} = 0.8225$.

∴ It is a ~~repet~~ terminating decimal expansion.

Solution (3) :-

(i) $\frac{13}{3125}$

Prime factorization of denominator 3125.

$$\begin{aligned} 3125 &= 5 \times 5 \times 5 \times 5 \times 5 \times 1 \\ &= 5^5 \times 1 \\ &= 1 \times 5^5 \end{aligned}$$

$$\begin{array}{r|l} 5 & 3125 \\ \hline 5 & 625 \\ \hline 5 & 125 \\ \hline 5 & 25 \\ \hline 5 & 5 \\ \hline & 1 \end{array}$$

∴ $3125 = 2^0 \times 5^5$ ($\because 2^0 = 1$)

Since, denominator is in the form of $2^0 \times 5^5$, the decimal expansion of $\frac{13}{3125}$ is terminating.

(ii) $\frac{17}{8}$

Prime factorization of denominator 8.

$$8 = 2 \times 2 \times 2$$

$$8 = 2^3 \times 1$$

$$8 = 2^3 \times 5^0$$

$$\begin{array}{r|l} 2 & 8 \\ \hline 2 & 4 \\ \hline 2 & 2 \\ \hline & 1 \end{array}$$

SOLUTION - 5

(i) $\sqrt{\frac{4}{9}}$, $-\frac{3}{70}$, $\sqrt{\frac{7}{25}}$, $\sqrt{\frac{16}{5}}$

Sol: $\sqrt{\frac{4}{9}} = \frac{\sqrt{4}}{\sqrt{9}}$

$= \frac{2}{3}$. It is in the form of $\frac{p}{q}$

and p, q are integers

Therefore $\sqrt{\frac{4}{9}}$ is a rational number.

$\Rightarrow -\frac{3}{70}$ is a rational number

$\Rightarrow \sqrt{\frac{7}{25}} = \frac{\sqrt{7}}{\sqrt{25}}$

$= \frac{\sqrt{7}}{5}$. Since $\sqrt{7}$ is not an integer

Therefore, $\sqrt{\frac{7}{25}}$ is an irrational number

$\Rightarrow \sqrt{\frac{16}{5}} = \frac{\sqrt{16}}{\sqrt{5}}$

$= \frac{4}{\sqrt{5}}$. Since $\sqrt{5}$ is not an integer

Therefore, $\sqrt{\frac{16}{5}}$ is an irrational number

$$(ii) \quad -\sqrt{\frac{2}{49}}, \frac{3}{200}, \sqrt{\frac{25}{3}}, -\sqrt{\frac{49}{16}}$$

$$\text{Sol:} \quad -\sqrt{\frac{2}{49}} = -\frac{\sqrt{2}}{\sqrt{49}}$$

$$= -\frac{\sqrt{2}}{7} \quad \text{Since } \sqrt{2} \text{ is not an Integer}$$

Therefore, $-\sqrt{\frac{2}{49}}$ is an irrational number

$\Rightarrow \frac{3}{200}$ It is in the form of $\frac{p}{q}$
and p, q are Integers. So, it
is a rational number

$$\Rightarrow \sqrt{\frac{25}{3}} = \frac{\sqrt{25}}{\sqrt{3}}$$

$$= \frac{5}{\sqrt{3}} \quad \text{since } \sqrt{3} \text{ is not an Integer}$$

Therefore, $\sqrt{\frac{25}{3}}$ is an irrational number

$$\Rightarrow -\sqrt{\frac{49}{16}} = -\frac{\sqrt{49}}{\sqrt{16}}$$

$$= -\frac{7}{4}$$

Therefore, $-\sqrt{\frac{49}{16}}$ is a rational number

SOLUTION-6

(i) $-3\sqrt{2}$

Sol: Since $\sqrt{2}$ is an irrational number

Therefore, $-3\sqrt{2}$ will change into non-terminating non-recurring decimal

(ii) $\sqrt{\frac{256}{81}}$

Sol:- $\frac{\sqrt{256}}{\sqrt{81}} = \frac{16}{9}$

$= 1.777777$

Therefore, $\sqrt{\frac{256}{81}}$ will not change into non-terminating non-recurring decimal

(iii) $\sqrt{27 \times 16}$

Sol:- $\sqrt{27} \times \sqrt{16} = \sqrt{9 \times 3} \times 4$

$= 4 \times 3\sqrt{3}$

$= 12\sqrt{3}$

$\therefore \sqrt{3}$ is an irrational number

Therefore, $\sqrt{27 \times 16}$ will change into non-terminating non-recurring decimal

(iv) $\sqrt{\frac{5}{36}}$

Sol:- $\frac{\sqrt{5}}{\sqrt{36}} = \frac{\sqrt{5}}{6}$

$\therefore \sqrt{5}$ is an irrational number

Therefore, $\sqrt{\frac{5}{36}}$ will change into non-terminating non-recurring decimal

SOLUTION-7

(i) $3 - \sqrt{\frac{7}{25}}$

Sol: $3 - \frac{\sqrt{7}}{\sqrt{25}}$

$$= 3 - \frac{\sqrt{7}}{5}$$

$$= \frac{15 - \sqrt{7}}{5} \quad \therefore \sqrt{7} \text{ is an irrational number}$$

Therefore, $3 - \sqrt{\frac{7}{25}}$ is also an irrational number

(ii) $-\frac{2}{3} + \sqrt[3]{2}$

Sol: Since $\sqrt[3]{2}$ is an irrational number.

Therefore, $-\frac{2}{3} + \sqrt[3]{2}$ is also an irrational number

(NOTE: Sum of rational and irrational number is irrational)

(iii) $\frac{3}{\sqrt{3}}$

Sol: $\frac{\sqrt{3} \times \sqrt{3}}{\sqrt{3}} = \sqrt{3}$

Since $\sqrt{3}$ is an irrational number

Therefore, $\frac{3}{\sqrt{3}}$ is also an irrational number.

(iv) $-\frac{2}{7} \sqrt[3]{5}$

Sol: Since $\sqrt[3]{5}$ is an irrational number

Therefore, $-\frac{2}{7} \sqrt[3]{5}$ is also an irrational number.

(Note: Product of rational and irrational number is irrational)

(v) $(2-\sqrt{3})(2+\sqrt{3})$

Sol: $2 \times 2 + 2\sqrt{3} - 2\sqrt{3} - (\sqrt{3})^2$

$= 4 - 3$

$= 1$

Therefore, $(2-\sqrt{3})(2+\sqrt{3})$ is a rational number

(vi) $(3+\sqrt{5})^2$

Sol: $(3)^2 + (\sqrt{5})^2 + 2 \times 3 \times \sqrt{5}$

$= 9 + 5 + 6\sqrt{5}$

$= 14 + 6\sqrt{5}$

Since $\sqrt{5}$ is an irrational number

$(3+\sqrt{5})^2$ is also an irrational number

$$(VII), \left(\frac{2}{5}\sqrt{7}\right)^2$$

$$\text{Sol: } \left(\frac{2}{5}\right)^2 \cdot (\sqrt{7})^2$$

$$= \frac{4}{25} \times 7$$

$$= \frac{28}{25}$$

Therefore, $\left(\frac{2}{5}\sqrt{7}\right)^2$ is a rational number

$$(VIII), (3-\sqrt{6})^2$$

$$\text{Sol: } (3)^2 + (\sqrt{6})^2 - 2 \times 3 \times \sqrt{6}$$

$$= 9 + 6 - 6\sqrt{6}$$

$$= 15 - 6\sqrt{6}$$

Since $\sqrt{6}$ is an irrational number

$(3-\sqrt{6})^2$ is also an irrational number

SOLUTION - 8 :

$$(i) \sqrt[3]{2}$$

Sol: Suppose that $\sqrt[3]{2} = \frac{p}{q}$, where p, q are integers, $q > 0$, p and q have no common factors (except 1)

$$2 = \left[\frac{p}{q}\right]^3$$

$$p^3 = 2q^3 \quad \rightarrow \textcircled{1}$$

As 2 divides $2q^3 \Rightarrow 2$ divides p^3

$\Rightarrow 2$ divides p

Let $p = 2k$, where k is an integer

Substituting this value of 'p' in (1), we get

$$(2k)^3 = 2q^3$$

$$8k^3 = 2q^3$$

$$4k^3 = q^3$$

As 2 divides $4k^3 \Rightarrow 2$ divides q^3

$\Rightarrow 2$ divides q

Thus p and q have a common factor "2".

This contradicts that p and q have no common factor (except 1).

Therefore, $\sqrt[3]{2}$ is an irrational number.

(ii) $\sqrt[3]{3}$

Sol: Suppose that $\sqrt[3]{3} = \frac{p}{q}$, where p, q are integers

$q > 0$, p and q have no common factors

(except 1).

$$3 = \left(\frac{p}{q}\right)^3$$

$$p^3 = 3q^3 \rightarrow (1)$$

As 3 divides $3q^3 \Rightarrow 3$ divides p^3

$\Rightarrow 3$ divides p

Let $P = 3K$, where K is an Integer

Substituting this value of 'P' in ①, we get

$$(3K)^3 = 3q^3$$

$$27K^3 = 3q^3$$

$$9K^3 = q^3$$

As 3 divides $9K^3 \Rightarrow 3$ divides q^3

$\Rightarrow 3$ divide q

Thus P and q have a common factor "3"
This contradicts that P and q have no
common factor (except 1);

Therefore, $\sqrt[3]{3}$ is an Irrational number.

(iii) $\sqrt[4]{5}$

Sol: Suppose that $\sqrt[4]{5} = \frac{p}{q}$, where p, q are Integers
 $q > 0$, p and q have no common factors
(except 1)

$$5 = \left(\frac{p}{q}\right)^4$$

$$p^4 = 5q^4 \rightarrow \text{①}$$

As 5 divides $5q^4 \Rightarrow 5$ divides p^4

$\Rightarrow 5$ divides p

Let $p = 5K$, where K is an Integer

Substituting this value of 'p' in ①, we get

$$(5K)^4 = 5q^4$$

$$625K^4 = 5q^4$$

$$125K^4 = q^4$$

As 5 divides $125K^4 \Rightarrow 5$ divides q^4

$\Rightarrow 5$ divides q

Thus p and q have a common factor "5"

This contradicts that p and q have no common factors (except 1)

Therefore, $\sqrt[4]{5}$ is an irrational number.

SOLUTION-9

$$-4 = -\sqrt{16}$$

$$\frac{4}{3}\sqrt{5} = \sqrt{\frac{16 \times 5}{9}}$$

$$= \sqrt{\frac{80}{9}}$$

$$= \sqrt{8.89}$$

$$\frac{3}{2}\sqrt{3} = \sqrt{\frac{9 \times 3}{4}}$$

$$= \sqrt{\frac{27}{4}}$$

$$= \sqrt{6.75}$$

$$\therefore -\sqrt{18}, \sqrt{16.2}, \sqrt{8.89}, -\sqrt{16}, \sqrt{6.75}$$

$$-3\sqrt{2} < -4 < \frac{3}{2}\sqrt{3} < \frac{4}{3}\sqrt{5} < \frac{9}{\sqrt{5}}$$

The greatest real number is $\frac{9}{\sqrt{5}}$

The smallest real number is $-3\sqrt{2}$

SOLUTION - 10

$$2\sqrt{3} = \sqrt{4} \times \sqrt{3} = \sqrt{12}$$

$$\sqrt{15} = \sqrt{15}$$

$$4 = \sqrt{16}$$

Since  $12 < 15 < 16 < 18$

$$\Rightarrow \sqrt{12} < \sqrt{15} < \sqrt{16} < \sqrt{18}$$

$$\Rightarrow 2\sqrt{3} < \sqrt{15} < 4 < 3\sqrt{2}$$

Hence, the given numbers in ascending orders are

$$2\sqrt{3}, \sqrt{15}, 4, 3\sqrt{2}$$

(ii)  $3\sqrt{2}$ ,  $2\sqrt{8}$ ,  $4$ ,  $\sqrt{50}$ ,  $4\sqrt{3}$

Sol: Write all the numbers as square roots under one radical

$$2\sqrt{8} = \sqrt{4} \times \sqrt{8} = \sqrt{32}$$

$$4 = \sqrt{16}$$

$$\sqrt{50} = \sqrt{50}$$

$$4\sqrt{3} = \sqrt{16} \times \sqrt{3} = \sqrt{48}$$

Since  $16 < 18 < 32 < 48 < 50$

$$\Rightarrow \sqrt{16} < \sqrt{18} < \sqrt{32} < \sqrt{48} < \sqrt{50}$$

$$\Rightarrow 4 < 3\sqrt{2} < 2\sqrt{8} < 4\sqrt{3} < \sqrt{50}$$

Hence, the given numbers in ascending orders are

$$4, 3\sqrt{2}, 2\sqrt{8}, 4\sqrt{3}, \sqrt{50}$$

SOLUTION - 11

(i)  $\frac{9}{\sqrt{2}}, \frac{3}{2}\sqrt{5}, 4\sqrt{3}, 3\sqrt{\frac{6}{5}}$

$$4\sqrt{3} = \sqrt{16 \times 3} = \sqrt{48}$$

$$3\sqrt{\frac{6}{5}} = \sqrt{9 \times \frac{6}{5}} = \sqrt{\frac{54}{5}} = \sqrt{10.8}$$

Since  $48 > 40.5 > 11.25 > 10.8$

$$\Rightarrow \sqrt{48} > \sqrt{40.5} > \sqrt{11.25} > \sqrt{10.8}$$

$$\Rightarrow 4\sqrt{3} > \frac{9}{\sqrt{2}} > \frac{3}{2}\sqrt{5} > 3\sqrt{\frac{6}{5}}$$

$$3\sqrt{5} = \sqrt{9} \times \sqrt{5} = \sqrt{45}$$

$$2\sqrt{7} = \sqrt{4} \times \sqrt{7} = \sqrt{28}$$

Since  $45 > 28 > 10.89 > 8.33 > -3$

### SOLUTION -4

$$(i) \frac{3-\sqrt{5}}{3+2\sqrt{5}} = -\frac{19}{11} + a\sqrt{5}$$

$$\begin{aligned}\text{Sol: } \frac{3-\sqrt{5}}{3+2\sqrt{5}} \times \frac{3-2\sqrt{5}}{3-2\sqrt{5}} &= \frac{(3-\sqrt{5})(3-2\sqrt{5})}{(3)^2 - (2\sqrt{5})^2} \\ &= \frac{9 - 6\sqrt{5} - 3\sqrt{5} + 2(5)}{9 - 4(5)} \\ &= \frac{19 - 9\sqrt{5}}{9 - 20} \\ &= \frac{+19 - 9\sqrt{5}}{-11} \\ &= -\frac{19}{11} + \frac{9}{11}\sqrt{5}\end{aligned}$$

$$\therefore -\frac{19}{11} + a\sqrt{5} = -\frac{19}{11} + \frac{9}{11}\sqrt{5}$$

$$\Rightarrow a = \frac{9}{11}$$

$$(ii) \frac{\sqrt{2} + \sqrt{3}}{3\sqrt{2} - 2\sqrt{3}} = a - b\sqrt{6}$$

$$= \frac{12 + 5\sqrt{6}}{6}$$

$$= 2 + \frac{5}{6}\sqrt{6}$$

$$= 2 - \left(-\frac{5}{6}\right)\sqrt{6}$$

$$= \frac{7 \cdot 28\sqrt{5}}{11 \cdot 44}$$

$$= \frac{7}{11} \times \sqrt{5}$$

$$\therefore a + \frac{7}{11} b\sqrt{5} = \frac{7}{11} \sqrt{5}$$

$$\Rightarrow a=0 ; b=1$$

SOLUTION - 5 :

$$(i) \frac{7+3\sqrt{5}}{3+\sqrt{5}} - \frac{7-3\sqrt{5}}{3-\sqrt{5}} = p+q\sqrt{5}$$

$$\begin{aligned} \text{Sol: } \frac{7+3\sqrt{5}}{3+\sqrt{5}} \times \frac{3-\sqrt{5}}{3-\sqrt{5}} &= \frac{(7+3\sqrt{5})(3-\sqrt{5})}{(3)^2 - (\sqrt{5})^2} \\ &= \frac{21 - 7\sqrt{5} + 9\sqrt{5} - 3(5)}{9-5} \\ &= \frac{21 + 2\sqrt{5} - 15}{4} \\ &= \frac{6+2\sqrt{5}}{4} \end{aligned}$$

$$\begin{aligned}
 \therefore \frac{7+3\sqrt{5}}{3+\sqrt{5}} - \frac{7-3\sqrt{5}}{3-\sqrt{5}} &= \frac{6+2\sqrt{5}}{4} - \frac{6-2\sqrt{5}}{4} \\
 &= \frac{6+2\sqrt{5} - 6 + 2\sqrt{5}}{4} \\
 &= \frac{4\sqrt{5}}{4} \\
 &= \sqrt{5}

$$\therefore p+q\sqrt{5} = \sqrt{5}$$

$$\Rightarrow p=0 ; q=1$$

SOLUTION -6 :

$$(i) \frac{\sqrt{2}}{2+\sqrt{2}}$$

$$\begin{aligned}
 \text{sol: } \frac{\sqrt{2}}{2+\sqrt{2}} \times \frac{2-\sqrt{2}}{2-\sqrt{2}} &= \frac{\sqrt{2}(2-\sqrt{2})}{(2)^2 - (\sqrt{2})^2} \\

$$(ii) \frac{1}{\sqrt{3}+\sqrt{2}}$$

$$\begin{aligned}\text{Sol: } \frac{1}{\sqrt{3}+\sqrt{2}} \times \frac{\sqrt{3}-\sqrt{2}}{\sqrt{3}-\sqrt{2}} &= \frac{\sqrt{3}-\sqrt{2}}{(\sqrt{3})^2 - (\sqrt{2})^2} \\ &= \frac{\sqrt{3}-\sqrt{2}}{3-2} \\ &= \sqrt{3}-\sqrt{2} \\ &= 1.732 - 1.414 \\ &= 0.318\end{aligned}$$

SOLUTION - 7 :

$$(i) a = 2 + \sqrt{3}$$

$$\begin{aligned}\text{Sol: } \frac{1}{a} &= \frac{1}{2+\sqrt{3}} = \frac{1}{2+\sqrt{3}} \times \frac{2-\sqrt{3}}{2-\sqrt{3}} \\ &= \frac{2-\sqrt{3}}{(2)^2 - (\sqrt{3})^2} \\ &= \frac{2-\sqrt{3}}{4-3} \\ &= 2-\sqrt{3}\end{aligned}$$

$$\begin{aligned}\therefore a - \frac{1}{a} &= 2 + \sqrt{3} - (2 - \sqrt{3}) \\ &= 2 + \sqrt{3} - 2 + \sqrt{3} \\ &= 2\sqrt{3}\end{aligned}$$

### SOLUTION - 8

(i)  $x = 1 - \sqrt{2}$

Sol: Given  $x = 1 - \sqrt{2}$

$$\begin{aligned}\therefore \frac{1}{x} &= \frac{1}{1 - \sqrt{2}} = \frac{1}{1 - \sqrt{2}} \times \frac{1 + \sqrt{2}}{1 + \sqrt{2}} \\ &= \frac{1 + \sqrt{2}}{(1)^2 - (\sqrt{2})^2} \\ &= \frac{1 + \sqrt{2}}{1 - 2} \\ &= -(1 + \sqrt{2})\end{aligned}$$

$$\begin{aligned}\therefore \left(x - \frac{1}{x}\right)^4 &= (1 - \sqrt{2} - (-1 - \sqrt{2}))^4 \\ &= (1 - \sqrt{2} + 1 + \sqrt{2})^4 \\ &= 2^4 \\ &= 16\end{aligned}$$

### SOLUTION - 9

(i)  $x = 5 - 2\sqrt{6}$

Sol: Given  $x = 5 - 2\sqrt{6}$

$$\begin{aligned}\therefore \frac{1}{x} &= \frac{1}{5 - 2\sqrt{6}} = \frac{1}{5 - 2\sqrt{6}} \times \frac{5 + 2\sqrt{6}}{5 + 2\sqrt{6}} \\ &= \frac{5 + 2\sqrt{6}}{(5)^2 - (2\sqrt{6})^2} \\ &= \frac{5 + 2\sqrt{6}}{25 - 24} \\ &= 5 + 2\sqrt{6}\end{aligned}$$

$$\begin{aligned}\therefore x + \frac{1}{x} &= (5 - 2\sqrt{6}) + (5 + 2\sqrt{6}) \\ &= 10\end{aligned}$$

We know that  $(x + \frac{1}{x})^2 = x^2 + \frac{1}{x^2} + 2$

$$\begin{aligned}\Rightarrow x^2 + \frac{1}{x^2} &= (x + \frac{1}{x})^2 - 2 \\ &= (10)^2 - 2 \\ &= 100 - 2 \\ &= 98\end{aligned}$$

SOLUTION - 10

$$(i) p = \frac{2 - \sqrt{5}}{2 + \sqrt{5}} \quad ; \quad q = \frac{2 + \sqrt{5}}{2 - \sqrt{5}}$$

$$\begin{aligned}\text{sol: } p + q &= \frac{2 - \sqrt{5}}{2 + \sqrt{5}} + \frac{2 + \sqrt{5}}{2 - \sqrt{5}} \\ &= \frac{(2 - \sqrt{5})^2 + (2 + \sqrt{5})^2}{(2)^2 - (\sqrt{5})^2} \\ &= \frac{(4 + 5 - 4\sqrt{5}) + (4 + 5 + 4\sqrt{5})}{4 - 5} \\ &= \frac{18}{-1}\end{aligned}$$

$$\therefore p + q = -18$$

$$\begin{aligned}
 \text{(ii) } p - q &= \frac{2-\sqrt{5}}{2+\sqrt{5}} - \frac{2+\sqrt{5}}{2-\sqrt{5}} \\
 &= \frac{(2-\sqrt{5})^2 - (2+\sqrt{5})^2}{(2)^2 - (\sqrt{5})^2} \\
 &= \frac{(4+5-4\sqrt{5}) - (4+5+4\sqrt{5})}{4-5} \\
 &= \frac{9-4\sqrt{5} - 9-4\sqrt{5}}{-1} \\
 &= -\frac{8\sqrt{5}}{-1} \\
 &= 8\sqrt{5}
 \end{aligned}$$

(iii)  $p^2 + q^2$

Sol: We know that

$$(p+q)^2 = p^2 + q^2 + 2pq$$

$$\therefore pq = \frac{2-\sqrt{5}}{2+\sqrt{5}} \times \frac{2+\sqrt{5}}{2-\sqrt{5}} = 1$$

$$\therefore p+q = -18$$

$$\begin{aligned}
 \Rightarrow p^2 + q^2 &= (p+q)^2 - 2pq \\
 &= (-18)^2 - 2 \times 1 \\
 &= 324 - 2 \\
 &= 322
 \end{aligned}$$

$$(iv) p^2 - q^2$$
